

Mark Turbutt BEng (Hons) CEng MICE

Director

Mark is a keen and practical engineer, who prides himself on being able to balance the sometimes very scientific side of this profession with other very important factors such as buildability, and not least economy. A strong background in different disciplines gained over his time in the industry means he is able to confidently deal with various aspects of a single scheme and provide clients with the single point of contact which JPP as a company always aims for.

Mark is a motivated team leader, passionate about getting others involved in all aspects of engineering. He has the ability to converse with the general public, contractors, clients and other professionals, and clearly explain what issues are being faced and how to resolve them, allowing him to draw all parties together to achieve their common goal.

Mark was responsible for obtaining DMRB Approvals for two new road crossings and for the widening of a third existing crossing to serve the new Marston Park development in Bedfordshire. He carried out all the civil engineering design and undertook detailed modelling of storage volumes within the earthworks bund at AD Plant, Rothwell.

Mark is also part of the team which has carried out structural safety inspections at many quarries, premix concrete plants and asphalt production plants, as well as many other sites, for many years.
